

## 1. Notes (Before installation)

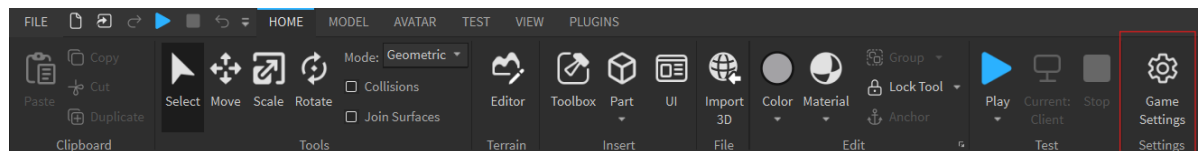

Before installing the system, make sure that you are the owner of the license. Game/place in which the installation is performed must be owned by your Roblox account or community/group and must be published to Roblox.

---

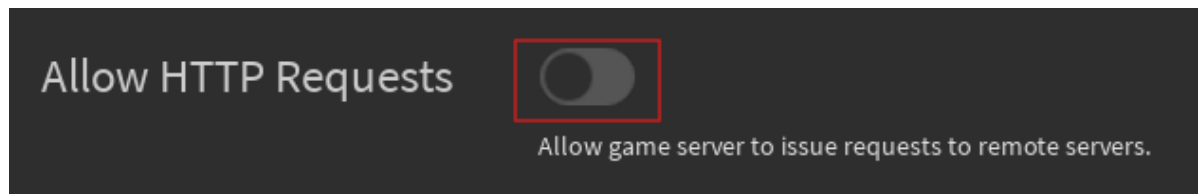

Please make sure that you have enabled HTTP requests in your game settings.

This action can be performed as follows:

1. Open the "HOME" tab in Roblox Studio and then press "Game Settings".

2. In the open tab, click on "Security". Find "Allow HTTP Request" and enable them.

3. Save changes.

Your game is ready for product installation.

## 2. Installation

Insert file with product to your game. There will be a special script with the name "MainSettings" inside the model; open it by using *Right mouse click* → *Open* or *double Left mouse click*.

Settings are also available for other models inside s\_keeper.

---

Quick navigation through the MainSettings.

- GlobalSettings — *Settings that affect all system components;*
  - ◆ ExpressMode — *Changes the behavior of the system;*
- CafeSettings — *Decorative settings;*
- DeviceSettings — *Changes behaviour of devices like KVS;*
- Items — *List with all items;*
- Discounts — *List with all available discounts;*
- Tables — *List with all available tables (ExpressMode == false);*
- Whitelist, WaiterWhitelist — *Whitelist;*
- ChatConfig — *Chat command configuration;*

---

You can change system configuration by editing values. They usually consist of ``True/False`` values.

---

Incorrect editing of the settings may lead to a breakdown or unexpected system behaviour.

In addition, please note the difference in the installation of s\_keeper from MCS230. **SGRServerOrderManagement** must be not moved to **Workspace** like in MCS230 installation.

---

Do not move SGRServerOrderManagement to Workspace or any other place.

---

Whitelist is of great importance in who exactly will be able to control the system. In the default setup, SGR representatives are on the whitelist.

You can change the whitelist by changing the values shown in the image.

```
local Users = {  
    "vo_sei",  
    "zeverdanoleg325",  
    "hz34gf",  
    "alexszechiuho"  
}  
local GroupId = 0  
local MinGroupRank = 0
```

You can also completely redesign the whitelist system, however it is not recommended for people without required knowledge.

## 3. Customisation

You can use custom models and interfaces if your model/UI does not violate our Terms Of Service.

Please note that we will not be able to provide support for heavily modified system.

## 4. Troubleshooting

Common problems and their solutions are listed here. If you encounter any problem not described here, please contact SGR support.

| Problem Name                  | Description                                          | Solution                                                               |
|-------------------------------|------------------------------------------------------|------------------------------------------------------------------------|
| Black screen                  | Appearance of a black screen after payment (kiosk).  | Re-install model.                                                      |
| Fatal Error screen            | Appearance of screen with "Fatal Error" label on it. | Disable scripts that can interfere with the system scripts in any way. |
| "License not found" ScreenGUI |                                                      | Please check <a href="#">Point 1.</a>                                  |

---

### END OF INSTALLATION GUIDE

This document is intended to provide a brief introduction to the SGR products. Please do not reuse this document in third-party projects.
